

Intellectual Property Assignment Agreement

The parties:

1. , of University of Twente, hereinafter referred to as "the Student"

and

2. The University of Twente, in particular the chairs "Computer Architecture for Embedded Systems, and Discrete Mathematics and Mathematical Programming, whose registered office is at Drienerlolaan 5, 7522 NB Enschede, represented by J. L. Hurink, hereinafter referred to as "UT",

whereas:

- UT offered the Student to participate in a research project which resulted in amongst other things a software package entitled "DEMKIT",
- UT has an interest in acquiring the ownership of the copyright on the DEMKIT;
- UT wishes to acquire such ownership, either with a view to contractual provisions in agreements with external clients, or because of the fact that UT's valorisation policy would not be complied with if UT were not in every respect the legal owner of the intellectual property rights of its research results;
- Student is aware of this and is willing to assign his copyrights on the DEMKIT to UT;

have agreed as follows:

- The Student hereby agrees to assign to UT, all his copyrights on the DEMKIT;
- The Student does not guarantee the objective accuracy and potential of the DEMKIT;
- UT will indemnify the Student against any claims by third parties arising from the use or application of the DEMKIT, if any;
- This agreement is governed by Dutch law. Any disputes ensuing from or relating to this agreement will be submitted to a competent court in the Netherlands.

Annex Description of DEMKIT

DEMKIT is a software tool written in Python to develop, model, simulate, and validate Decentralized Energy Management solutions. It contains models and behavioural descriptions of energy consuming, producing, converting and storing devices in the broader sense, i.e. it supports multiple energy carriers such as electricity, gas and heat. Next to these device components, it also contains models for the physical infrastructure to transport the energy, including load-flow solvers to determine the steady state of such a network. Part of DEMKIT are also the implemented control and optimization algorithms to perform Decentralized Energy Management. These control and optimization strategies are split up in coordination algorithms (e.g. the Profile Steering algorithm) and specific device level optimization and control algorithms.
